

This is sample practice intended for you to explore, discover, revise on the topic and encourage the discussion with each others.

Use only the knowledge from Chapter 8 to solve the following. Feel free to propose any work around as long as within the scope of CH 8

Simple Challenge 5

- Given the data of *telco_customer_churn.csv*
- Assume you are to explore the data and try to answer following questions:
 - Look into the aspects of **InternetService** categories, drill down into **gender**, what are the minimum, maximum, average and the difference (max – min) of monthly charges for each of the group?
 - Investigate how is the **OnlineSecurity** feature's reception among senior and non-senior citizen?
 - Investigate the customers (churn vs not churn) on their subscription of **InternetService**, see if it affects the tenure? (can look at the average and the different between min and max tenure in these categories)
